

R1 Electric strike

Note

The R1 Electric Strike is designed for remote opening of right and left, as well as double-wing doors and gates, in co-operation with the door lock striker. It is made of aluminium alloys and powder-painted. It is designed to be mounted within a doorframe, in which it is possible to make a 28x56x78 mm mounting hole (draw on the right).

The R1 Electric Strike can work together with home interphone installation in all types of an entrance door. It should be protected against hostile weather impacts, moisture, and being accidentally coated with paint.

Electric strike version

Basic version - the basic type, making it possible to unblock the door upon voltage being supplied to the coil.

When working, the lock gives out a low, humming noise.
